

ROADRESQ

App Flow Document

Version 1.0 • UX / Navigation Specification

“Request → Match → Track → Repair → Pay → Review”

Customer • Provider • Admin • Emergency Assistance • Garage Services

Screen-to-screen navigation and state-flow specification for RoadResQ.

1. Purpose

This document defines the complete screen flow and navigation structure for RoadResQ. It is intended to guide UI/UX design, frontend development, user testing, and implementation of the customer, provider, and admin applications.

The most important flow is the emergency assistance journey. Every screen should reduce confusion and keep the next action obvious.

2. Product Navigation Model

3. Global Entry Flow

Returning users should not repeatedly see onboarding. Session restoration should route authenticated users directly to their appropriate dashboard.

4. Onboarding Flow

SPLASH

INTRO / VALUE PROPOSITION
↓
LOGIN / SIGN UP
↓
PHONE / EMAIL
↓
OTP VERIFICATION
↓
BASIC PROFILE
↓
ADD VEHICLE
↓
LOCATION PERMISSION
↓
CUSTOMER HOME

- Allow skipping non-essential profile fields
- Explain why location is needed before requesting permission
- Do not block account creation unnecessarily
- Preserve progress if onboarding is interrupted

5. Customer Bottom Navigation

HOME | BOOKINGS | VEHICLES | HISTORY | PROFILE

The emergency CTA should remain visually prominent on Home and should not be buried inside navigation.

6. Customer Home Flow

CUSTOMER HOME
— **GET HELP NOW** → Emergency Flow
— **FIND GARAGE** → Garage Discovery
— **BOOK SERVICE** → Scheduled Service
— **MY VEHICLES** → Vehicle Management
— **ACTIVE BOOKING** → Live Job

ANY SCREEN

↓

ERROR

- Retry

- **Go Back**
- **Contact Support**
- **Safe Home Route**

- Network unavailable → preserve local form state where possible
- Session expired → authenticate and return to intended screen
- Location denied → manual location fallback
- Payment failed → retry without duplicate transaction
- Provider cancelled → rematch or offer alternatives
- Booking expired → explain reason and provide new request option

40. Deep-Link Rules

- Push notification for active job opens the relevant booking screen
- Provider request notification opens request details
- Estimate notification opens estimate review
- Invoice notification opens invoice
- Support notification opens ticket details

Every deep-linked screen must verify authentication and resource authorization before displaying data.

41. Navigation Rules

- Back navigation should never accidentally cancel an active job
- Emergency flow should preserve entered information when moving backward
- Active booking should remain accessible from Home
- Completed jobs should be reachable from History
- Provider active jobs should remain visible until closed
- Admin actions requiring confirmation should use explicit confirmation dialogs

42. Critical States

- ↳ Analytics → Reports

47. Critical UX Principle

The emergency flow must always make the next action obvious. During an active roadside incident, avoid unnecessary forms, decorative complexity, or navigation that distracts from the task.

Core customer promise: “I know who is coming, where they are, when they will arrive, what is happening, and what I need to do next.”

48. App Flow Completion Criteria

- All screens have a defined entry and exit point
- Every primary CTA maps to a valid next state
- Every booking status has a corresponding UI state
- No dead-end screens exist without recovery actions
- Loading, empty, offline, error, cancellation, and payment states are designed
- Deep links resolve to authorized resources
- Customer, provider, and admin flows remain separated by permissions
- The emergency flow can be completed without unnecessary navigation

49. Final End-to-End Flow

50. Document Conclusion

This app flow establishes RoadResQ as a three-sided platform: a low-friction customer experience, an operational provider experience, and a controlled admin command center. The emergency assistance loop is the MVP's central journey, while garage discovery, scheduled service, service history, and garage-management capabilities expand the product beyond one-time roadside emergencies.

RoadResQ flow principle: Request → Match → Track → Inspect → Approve → Repair → Pay → Review.
