

# ROADRESQ

## Customer Support & Dispute SOP

Standard Operating Procedure • Version 1.0

**Purpose:** Define how RoadResQ handles cancellations, customer/provider complaints, refunds, payment disputes, damaged vehicle claims and service-quality incidents.

RECEIVE → TRIAGE → PROTECT → INVESTIGATE → DECIDE → RESOLVE → RECORD → LEARN

**Applies to:** Customer Support • Operations • Trust & Safety • Finance • Admin • Providers • Engineering

# Document Control

| Field             | Value                                                                                                                       |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------|
| Document          | RoadResQ Customer Support & Dispute SOP                                                                                     |
| Version           | 1.0                                                                                                                         |
| Status            | Production operating baseline                                                                                               |
| Primary users     | Customer Support, Operations, Trust & Safety, Finance and Admin                                                             |
| Scope             | Cancellations, refunds, service disputes, damaged vehicle claims and provider complaints                                    |
| Related documents | SRS • API Specification • Security & Threat Model • QA Plan • Provider Operations SOP • Production Runbook • Backup/DR Plan |
| Core principle    | Customer safety first; evidence-based, fair and auditable resolution                                                        |

## 1. Purpose & Principles

RoadResQ support must provide a consistent way to resolve customer problems without compromising safety, provider fairness, payment integrity or evidence quality. Support agents should resolve straightforward issues quickly and escalate complex, high-risk or high-value disputes.

- Protect people first, then vehicles, payments and platform integrity.
- Treat customers and providers fairly while remaining neutral during investigation.
- Use evidence and booking records rather than assumptions.
- Never promise a refund, liability decision or compensation before authorization.
- Do not expose private information belonging to another party.
- Critical safety, fraud and abuse cases must be escalated immediately.
- Every material dispute must have a traceable case record.
- Customer support should minimize unnecessary back-and-forth.

## 2. Support Channels & Case Sources

| Source           | Typical cases                                                              |
|------------------|----------------------------------------------------------------------------|
| In-app support   | Booking issues, cancellations, payment status, service complaints          |
| Chat             | Real-time assistance during an active booking                              |
| Email/ticket     | Documents, detailed disputes, refund follow-up                             |
| Phone/callback   | Urgent active-job or complex support cases where supported                 |
| Provider report  | Customer complaints, payment disputes, unsafe situations                   |
| Automated alert  | Payment failure, duplicate request, provider cancellation, system incident |
| Admin escalation | Fraud, safety, legal, high-value or repeated incidents                     |

## 3. Case Priority Levels

| Priority    | Examples                                                                     | Target handling          |
|-------------|------------------------------------------------------------------------------|--------------------------|
| P0 Critical | Immediate physical safety risk, active threat, severe accident-related issue | Immediate escalation     |
| P1 Urgent   | Active customer stranded, provider misconduct, major payment/booking failure | Rapid human intervention |

| Priority    | Examples                                                        | Target handling    |
|-------------|-----------------------------------------------------------------|--------------------|
| P2 Standard | Refund request, cancellation dispute, service-quality complaint | Normal support SLA |
| P3 Low      | General question, feedback, non-urgent account issue            | Routine queue      |

## 4. Case Lifecycle

| State               | Meaning                                                   |
|---------------------|-----------------------------------------------------------|
| OPEN                | Case created and awaiting triage                          |
| TRIAGED             | Category, priority and responsible queue assigned         |
| INVESTIGATING       | Evidence is being reviewed                                |
| WAITING_CUSTOMER    | Required customer information is pending                  |
| WAITING_PROVIDER    | Provider response/evidence is pending                     |
| WAITING_FINANCE     | Refund/payment review is pending                          |
| ESCALATED           | Transferred to specialized authority                      |
| RESOLUTION_PROPOSED | Decision/action prepared for execution                    |
| RESOLVED            | Action completed and customer/provider informed           |
| CLOSED              | Case finalized with no further action required            |
| REOPENED            | New material evidence or unresolved issue requires review |

## 5. Standard Case Intake

- Capture customer/user ID and booking ID where applicable.
- Capture provider ID when a provider is involved.
- Record issue category, date/time and current booking state.
- Record a concise description in the customer's own terms.
- Capture relevant photos, videos, receipts, invoices or messages only when necessary.
- Identify whether the vehicle is currently safe/operable and whether the customer is stranded.
- Check whether payment is completed, pending, failed or disputed.
- Assign priority and queue.
- Create an auditable case record before taking material action.

## 6. Cancellation Policy Framework

Cancellation decisions should use the booking state, who initiated the cancellation, timing, provider actions and any applicable platform policy.

| Scenario                                 | Operational handling                                                       |
|------------------------------------------|----------------------------------------------------------------------------|
| Customer cancels before provider accepts | Usually close request without service charge unless policy says otherwise. |
| Customer cancels after provider accepts  | Check provider effort/arrival state and configured cancellation rules.     |
| Customer cancels after provider arrives  | Review work already performed and applicable charges.                      |
| Provider cancels before arrival          | Re-match or assist customer; review provider reliability if repeated.      |

| Scenario                       | Operational handling                                                                     |
|--------------------------------|------------------------------------------------------------------------------------------|
| Provider cancels after arrival | Protect customer first; arrange alternate service and investigate.                       |
| System cancellation            | Check platform logs and booking state; avoid charging for a platform-caused failure.     |
| Duplicate request              | Identify original active request and prevent duplicate charging/dispatch where possible. |

## 7. Customer Cancellation SOP

- Confirm booking identity and current status.
- Determine cancellation initiator and timestamp.
- Check whether provider accepted, travelled, arrived or performed work.
- Apply the configured cancellation policy.
- If a fee applies, explain the basis clearly before finalizing where possible.
- If no fee applies, cancel and confirm.
- If a refund is due, create the appropriate refund action.
- If the customer disputes the fee, open a dispute instead of repeatedly cancelling/retrying payment.
- Record the cancellation reason and outcome.

## 8. Provider Cancellation SOP

- Confirm provider cancellation event from authoritative booking history.
- Check whether the customer is still stranded.
- Immediately prioritize re-matching or support intervention for active roadside needs.
- Do not leave the customer without a clear next step.
- Review provider cancellation reason.
- If repeated or suspicious, route provider for operational review.
- Resolve any payment/refund consequences.
- Record impact on customer and provider.

## 9. Dispute Categories

| Category                  | Examples                                                               |
|---------------------------|------------------------------------------------------------------------|
| Cancellation dispute      | Customer contests cancellation fee or provider cancellation outcome.   |
| Pricing dispute           | Estimate/invoice amount differs from expectation or approval.          |
| Service quality           | Repair/service did not meet expected standard.                         |
| Unauthorized work         | Customer alleges work was performed without required approval.         |
| Payment dispute           | Duplicate charge, failed payment, pending payment or incorrect amount. |
| Damaged vehicle           | Customer alleges vehicle damage during assistance/service.             |
| Provider conduct          | Rude, abusive, threatening or inappropriate behavior.                  |
| No-show                   | Provider accepted but did not arrive or became unreachable.            |
| Fraud/suspicious activity | Potential manipulation, fake service, account abuse or payment abuse.  |

## 10. Dispute Investigation SOP

- Freeze or flag the disputed financial action when necessary and permitted.

- Review booking status history and timestamps.
- Review provider acceptance, arrival and completion records.
- Review estimate and customer approval records.
- Review job card and inspection data.
- Review invoice and payment records.
- Review relevant customer/provider messages.
- Review authorized location/timeline evidence when relevant.
- Request additional evidence only when it can materially affect the decision.
- Determine whether the issue is operational, financial, safety-related or potentially fraudulent.
- Document findings and decision rationale.

## 11. Evidence Hierarchy

Evidence should be weighted by reliability and context rather than by who submitted it.

| Evidence                                       | Typical value           |
|------------------------------------------------|-------------------------|
| Authoritative booking state history            | High                    |
| Payment gateway transaction/webhook records    | High                    |
| Approved estimate / invoice                    | High                    |
| Job card / inspection records                  | High                    |
| Time-stamped customer/provider messages        | Medium-High             |
| Authorized location/timeline data              | Medium-High             |
| Photos/videos with relevant timestamps/context | Medium-High             |
| Screenshots without context                    | Medium-Low              |
| Unverified verbal claims                       | Low unless corroborated |

## 12. Refund SOP

Refunds must be linked to an identifiable payment and authorized according to the configured refund policy.

- Verify the original payment and booking.
- Determine whether the refund is full, partial or not applicable.
- Confirm no duplicate refund already exists.
- Check payment state before initiating the refund.
- Use the payment provider's supported refund mechanism where applicable.
- Record refund amount, reason, actor and timestamp.
- Communicate expected processing timing without guaranteeing bank/provider settlement timing.
- If payment status is uncertain, reconcile before creating another refund.
- Escalate unusual or high-value refunds.

## 13. Refund Decision Matrix

| Situation               | Typical decision                              |
|-------------------------|-----------------------------------------------|
| Platform-caused failure | Refund applicable amount according to policy. |

| Situation                            | Typical decision                                                                |
|--------------------------------------|---------------------------------------------------------------------------------|
| Provider cancels before service      | Refund customer for applicable paid amount.                                     |
| Duplicate charge                     | Refund verified duplicate amount.                                               |
| Overcharge confirmed                 | Refund difference.                                                              |
| Customer cancellation with valid fee | Refund remaining eligible amount.                                               |
| Unauthorized work allegation         | Hold/flag disputed amount and investigate before final decision where possible. |
| Service-quality dispute              | Refund/credit only after evidence review and applicable policy.                 |
| Payment pending                      | Do not issue duplicate refund; reconcile first.                                 |
| Fraud suspected                      | Escalate; preserve evidence and follow financial/security controls.             |

## 14. Payment Dispute & Reconciliation

- Use the payment provider's transaction identifier and RoadResQ payment record together.
- Treat webhook events as asynchronous and potentially delayed.
- Do not rely only on the customer-visible payment screen.
- Use idempotency to prevent duplicate refund/payment actions.
- For chargebacks or bank-level disputes, preserve transaction and booking evidence.
- Finance owns final financial reconciliation for escalated cases.
- Record discrepancies between internal and gateway states.
- Never manually mark a payment successful without authoritative evidence.

## 15. Damaged Vehicle Claim — Intake

Vehicle damage claims are higher-risk disputes because causation may be uncertain. Support must not automatically admit liability or deny the claim before evidence review.

- Confirm booking, vehicle and provider.
- Ask when the customer first noticed the alleged damage.
- Capture photos/videos of the affected area where safely possible.
- Capture relevant pre-service and post-service evidence if available.
- Record the service performed and job completion details.
- Review inspection items and provider notes.
- Review estimate, approved work and invoice.
- Review messages and authorized timeline/location evidence.
- Escalate serious or high-value claims to the designated claims/Trust & Safety authority.

## 16. Damaged Vehicle Claim — Investigation

| Question                                      | Why it matters                         |
|-----------------------------------------------|----------------------------------------|
| Was the damage documented before service?     | Helps distinguish pre-existing damage. |
| Was the affected component touched/worked on? | Establishes potential relevance.       |
| Was an inspection recorded?                   | Provides contemporaneous evidence.     |
| Was customer approval obtained?               | Clarifies authorized work.             |
| Did the provider report an incident?          | May corroborate causation/timeline.    |

| Question                                | Why it matters                      |
|-----------------------------------------|-------------------------------------|
| Are there time-stamped photos/videos?   | Supports before/after comparison.   |
| Are there independent records/receipts? | May establish repair/cost evidence. |
| Is there immediate safety risk?         | Determines urgent escalation.       |

## 17. Damaged Vehicle Claim Outcomes

- No substantiated damage: explain findings and close/resolve.
- Provider error or responsibility supported: apply approved compensation/refund process.
- Customer contribution or pre-existing damage likely: document and explain outcome.
- Evidence insufficient: record uncertainty and follow the configured claims/escalation process.
- Severe damage, injury or legal threat: escalate immediately to the appropriate authority.
- Never instruct customers to continue driving an unsafe vehicle.

## 18. Provider Complaint SOP

- Capture the exact complaint category.
- Determine whether the provider behavior affected safety, service quality or payment.
- Review the provider's response where appropriate.
- Check for repeated complaints or related cases.
- Avoid sharing customer private information unnecessarily with the provider.
- If the complaint indicates safety, abuse or fraud, escalate to Provider Operations/Trust & Safety.
- Record outcome and any provider corrective action.
- Do not retaliate against either party for making a good-faith complaint.

## 19. Provider Complaint Severity

| Severity | Examples                                                      | Action                                             |
|----------|---------------------------------------------------------------|----------------------------------------------------|
| Critical | Threats, physical danger, serious harassment, suspected fraud | Immediate escalation; possible provider suspension |
| High     | Major misconduct, repeated no-show, serious unauthorized work | Priority investigation                             |
| Medium   | Repeated poor communication, unreasonable service behavior    | Corrective action/review                           |
| Low      | Minor rudeness or isolated dissatisfaction                    | Coaching/feedback where appropriate                |

## 20. Customer Complaint Against RoadResQ

- Acknowledge the issue and summarize what will be reviewed.
- Avoid defensive language or premature conclusions.
- Identify whether the issue is product, provider, payment, policy or support-related.
- If RoadResQ caused the issue, route for corrective action and appropriate remedy.
- If policy is the reason for the outcome, explain the policy in plain language.
- Capture product bugs or systemic failures for engineering/product review.
- Do not close a complaint solely because the customer disagrees; document the final rationale.

## 21. Safety & Emergency Escalation

RoadResQ support is not a replacement for police, ambulance, fire or other public emergency services.

- If a customer reports immediate danger or injury, prioritize getting them to appropriate emergency services.
- Do not delay urgent safety action while collecting non-essential evidence.
- Flag threats, violence, harassment or dangerous provider behavior immediately.
- For unsafe vehicle conditions, advise the customer not to drive if continuing could create danger.
- Record safety escalation and relevant timestamps.

## 22. Fraud & Abuse Handling

- Do not accuse customers/providers of fraud based on a single anomaly.
- Escalate suspicious patterns to the authorized Trust & Safety team.
- Preserve relevant evidence and audit records.
- Restrict sensitive account/payment actions where authorized and necessary.
- Do not reveal internal fraud detection rules.
- Coordinate with Finance/Security for payment abuse or account compromise.
- Apply consistent enforcement across comparable cases.

## 23. Support Communication Standards

- Use clear, respectful and non-accusatory language.
- Explain what is known, what is under review and what happens next.
- Do not promise an outcome before investigation.
- Avoid blaming the customer or provider.
- Do not expose internal notes, security signals or another party's private data.
- For delays, provide the next checkpoint rather than vague assurances.
- For final decisions, explain the applicable evidence/policy at an appropriate level.

## 24. Case Notes Standard

Every investigation note should be concise and factual.

**Recommended structure:** Issue → Evidence reviewed → Findings → Policy/rule applied → Decision → Action taken → Customer/provider communication → Follow-up.

- Do not write emotional judgments or unsupported accusations.
- Record timestamps and identifiers needed to reproduce the case.
- Separate verified facts from claims.
- Avoid unnecessary sensitive personal information.

## 25. Escalation Matrix

| Case                        | Primary owner      | Escalate to                                  |
|-----------------------------|--------------------|----------------------------------------------|
| Routine cancellation/refund | Customer Support   | Finance if payment reconciliation is needed  |
| Pricing/estimate dispute    | Support/Operations | Provider Operations / Finance                |
| Damaged vehicle claim       | Support/Claims     | Trust & Safety / designated claims authority |

| Case                    | Primary owner | Escalate to                                        |
|-------------------------|---------------|----------------------------------------------------|
| Provider misconduct     | Support       | Provider Operations / Trust & Safety               |
| Fraud/payment abuse     | Support       | Trust & Safety + Finance/Security                  |
| Immediate safety threat | Support       | Trust & Safety / emergency services as appropriate |
| Systemic product bug    | Support       | Engineering/Product                                |
| Legal request/threat    | Support       | Designated legal/compliance authority              |

## 26. Customer Compensation Controls

- Compensation must use configured authorization limits.
- High-value compensation requires elevated approval.
- Avoid compensation that creates duplicate reimbursement.
- Record compensation reason, amount/type and approver.
- Credits, refunds and goodwill adjustments must be distinguishable in financial records.
- Compensation should not be used to conceal a safety or fraud incident.

## 27. Duplicate & Conflicting Cases

- Search for existing cases using booking/payment/provider identifiers before creating a new investigation.
- Link duplicate cases to a primary case.
- Do not issue multiple refunds for the same incident.
- If two agents reach conflicting decisions, escalate rather than applying both actions.
- Maintain a single authoritative resolution record.

## 28. SLA & Queue Management

| Case type                    | Operating rule                                                           |
|------------------------------|--------------------------------------------------------------------------|
| P0 safety                    | Immediate human escalation                                               |
| P1 active-job issue          | Prioritize while customer impact is ongoing                              |
| Refund request               | Process within configured support/finance SLA                            |
| Damaged vehicle claim        | Acknowledge quickly; investigation timing depends on evidence complexity |
| Provider complaint           | Review within configured provider-operations SLA                         |
| Waiting on customer/provider | Send follow-up reminders according to configured cadence                 |
| Stale case                   | Escalate or close only after defined follow-up process                   |

## 29. Support Tools & Case Data

| Data             | Use                                                      |
|------------------|----------------------------------------------------------|
| Booking timeline | Determine authoritative sequence of events               |
| Status history   | Validate transitions and cancellation/arrival/completion |
| Job card         | Review work performed                                    |
| Inspection       | Review pre/post-service observations                     |
| Estimate/invoice | Validate approved and billed amounts                     |
| Payment records  | Validate payment/refund state                            |

| Data              | Use                                           |
|-------------------|-----------------------------------------------|
| Messages          | Review relevant communications                |
| Location timeline | Validate authorized movement/arrival evidence |
| Provider profile  | Review verification/performance context       |
| Audit log         | Determine who changed what and when           |

## 30. Privacy & Evidence Handling

- Collect only information necessary to resolve the case.
- Restrict access to sensitive documents, payment data and location records.
- Do not download/share customer or provider data outside approved systems.
- Mask sensitive payment and identity information in support views where possible.
- Use secure evidence storage with controlled access.
- Follow configured retention/deletion policies.
- Do not expose one party's private information to the other party.

## 31. Resolution Outcomes

| Outcome           | Meaning                                                             |
|-------------------|---------------------------------------------------------------------|
| RESOLVED_CUSTOMER | Customer issue resolved with no financial adjustment.               |
| REFUND_FULL       | Eligible full refund completed/initiated.                           |
| REFUND_PARTIAL    | Eligible partial refund completed/initiated.                        |
| CREDIT            | Approved platform credit/goodwill adjustment.                       |
| NO_ADJUSTMENT     | Investigation found no applicable adjustment.                       |
| PROVIDER_ACTION   | Provider coaching/restriction/suspension/referral initiated.        |
| RE_MATCHED        | Customer received alternative provider/service.                     |
| ESCALATED         | Specialist/claims/security/legal review required.                   |
| SYSTEM_FIX        | Engineering/product action required in addition to case resolution. |

## 32. Appeal / Reconsideration

- Allow reconsideration where new material evidence exists or policy permits.
- Do not restart an investigation solely because the customer repeats the same information without new evidence.
- Route complex appeals to an authorized reviewer.
- Document what changed, if anything, between the original and final decision.
- Do not expose protected fraud/security rules.

## 33. Quality Assurance for Support

- Sample resolved cases for evidence quality and policy compliance.
- Check whether refunds/credits were authorized correctly.
- Check that customer communications are accurate and respectful.
- Review escalations for correct routing.
- Track repeat-contact cases.

- Identify systemic problems causing recurring disputes.
- Use QA findings for training and process improvement.

## 34. Support KPIs

| KPI                      | Purpose                                                |
|--------------------------|--------------------------------------------------------|
| First response time      | Measure speed of customer acknowledgement.             |
| Resolution time          | Measure end-to-end case efficiency.                    |
| First-contact resolution | Measure issues resolved without unnecessary follow-up. |
| Reopen rate              | Identify incomplete or incorrect resolutions.          |
| Refund processing time   | Measure financial resolution speed.                    |
| Dispute rate             | Monitor service/payment friction.                      |
| Provider complaint rate  | Monitor provider-related customer harm/friction.       |
| Damaged-claim rate       | Monitor service/vehicle incident patterns.             |
| Escalation rate          | Identify complexity and support training needs.        |
| Customer satisfaction    | Measure support experience.                            |

## 35. Operational Audit Requirements

- Every case has an owner and status.
- Every financial action has an actor and reason.
- Every escalation has a destination and timestamp.
- Every final dispute decision has evidence and rationale.
- Provider enforcement resulting from customer complaints is linked to the relevant case.
- Refunds are linked to the original payment.
- Duplicate case/refund prevention checks are performed.
- Sensitive evidence access follows authorization controls.

## 36. Critical Support Test Scenarios

- Customer cancels before provider acceptance.
- Customer cancels after provider acceptance.
- Provider cancels while customer is stranded.
- Provider arrives but customer disputes charges.
- Payment is pending when customer requests refund.
- Duplicate payment is detected.
- Customer claims unauthorized repair work.
- Customer reports vehicle damage after service.
- Provider disputes a customer complaint.
- Customer reports threatening provider behavior.
- Customer submits new evidence after dispute closure.
- Two support agents create duplicate cases.
- Refund webhook is delayed.

- Booking state and payment state disagree.
- System failure causes cancellation or duplicate request.

## 37. Engineering & Workflow Enforcement

- Refund endpoints must be idempotent.
- Support agents must not be able to modify authoritative booking history.
- Financial actions require permission checks and audit records.
- Case actions must be object-authorized by role and scope.
- Provider/customer private data must be access-controlled.
- Payment status must be reconciled against authoritative gateway records.
- Dispute evidence must be immutable or versioned after submission where appropriate.
- Case state transitions must be server-authoritative.

## 38. Definition of Done

- Cancellation rules are documented and mapped to booking states.
- Refund flows are authorized, idempotent and auditable.
- Customer/provider complaint categories exist.
- Damaged vehicle claim workflow is defined.
- Evidence collection and privacy rules are documented.
- P0/P1 escalation paths are operational.
- Support case lifecycle is implemented.
- Provider complaints can route to Provider Operations/Trust & Safety.
- Payment reconciliation is available to authorized teams.
- Duplicate/refund conflict handling is tested.
- Support QA and KPI reporting are defined.
- Production support staff have access to this SOP and related runbooks.

## 39. Final Support Standard

RoadResQ support is part of the product's trust system. A successful support operation does more than answer tickets: it protects stranded customers, preserves fair treatment of providers, prevents duplicate financial actions, investigates vehicle/service disputes with evidence, and turns recurring incidents into product and operational improvements. Every serious case should leave the platform safer, clearer and more reliable than before.
